

Data Use Policy

Retention, access control, permitted and prohibited uses of the safety score

Project	Course	Case Study	Version
HaulTrack - 1,800-truck fleet telematics	B.Tech CSE - Software Engineering & Project Management	No. 19	1.0 (baseline)

Plain-language policy attached to the requirements. Intended to be shown to the drivers' union. It should be reviewed by Legal / Data Protection against applicable law (for an Indian operator, the Digital Personal Data Protection Act, 2023) before adoption; this document is a project deliverable, not legal advice.

1. Principles

- The safety score is a **coaching tool**. It helps drivers and managers see patterns; it does not decide a person's employment.
- We collect only what we need to run safe operations and to show the insurer that safety has improved, and no more.
- Drivers can see what is recorded about them, how the score is built, and challenge it.
- The score must be **fair across terrain**. A driver is not marked down for braking that a hill makes unavoidable.

2. What is collected - and what is not

Collected (ignition on only)	Not collected
Position, speed, harsh braking, idling and fuel level every 30 seconds while the truck is on duty; derived events (harsh braking, speeding, idling) with road gradient	Anything while the ignition is off or the driver is logged off; in-cab audio or video; the driver's personal phone; private-time location

3. Retention schedule

Tier	Content	Retention	Why this long (insurer evidence vs. privacy)
A Raw telemetry	30-second records with position	90 days , then deleted	Long enough to resolve disputes and incident claims; position traces are not needed beyond that. Limits surveillance.
B Event records	Harsh-braking and other events: time, severity, gradient band, road segment (not coordinates)	13 months identified , then pseudonymised (driver identity removed irreversibly) for up to 36 months	13 months covers one full policy / appraisal year plus pending appeals. After that the insurer can still verify counts without knowing who.
C Aggregates	Depot and terrain-class rates per 100 km, by period	36 months	Insurer needs a baseline year, a post-change year and a renewal comparison; this is the evidence of harsh-braking reduction.
Safety score	28-day score and breakdown	Current and 13 months of history, then deleted	Supports coaching trends and appeals only.
Audit log	Who accessed what, when and why	36 months	Proof that this policy was followed.

Insurer requirement vs. design: the insurer's need is a **trend of harsh braking per 100 km**, which tiers B (pseudonymised) and C provide. It does not need long-lived raw position traces or named drivers, so those are not kept.

4. Access control

Role	Raw position (A)	Events (B)	Individual score	Aggregates (C)	Audit log
Driver (own data)	Own, 90 d	Own, 13 m	Own, with breakdown	No	No
Team manager	No	Own team, coaching only	Own team, coaching only, each access logged	Own team	No

Role	Raw position (A)	Events (B)	Individual score	Aggregates (C)	Audit log
Fleet manager	No	Team distribution	Via coaching access only; no export	Yes	No
Dispatcher	Live position of trucks on shift (route alerts)	No	No	No	No
HR / disciplinary panel	No	Verified incident records only	Never as evidence	No	No
Insurer	No	Pseudonymised only	No	Yes	No
Independent auditor	Samples under NDA	Samples	No	Yes	Yes
Union reps / Governance Board	No	No	Own member data on request	Yes	Summary reports
Platform administrator	Technical access, logged, no browsing	No	No	No	Yes (append-only)
Data Protection Officer	On request	On request	On request	Yes	Yes

Every access is authenticated, purpose-stated and recorded in an append-only audit log reviewed quarterly and summarised to the union.

5. Permitted uses of the safety score

- A private conversation between a driver and a coach about patterns the driver can act on.
- Choosing training topics for a depot or group.
- Fleet-level and depot-level trend reporting, including to the insurer, in aggregate only.
- Recognising improvement over a driver's own history (not against other drivers).
- Investigating a specific incident, **together with** verified incident evidence and human review.

6. Prohibited uses of the safety score

- Dismissal, demotion, suspension, or any disciplinary action based on the score alone or mainly on the score.
- Pay, bonus, overtime or route allocation decisions as a penalty linked to the score.
- Publishing or circulating rankings or league tables of drivers.
- Giving the insurer or any third party driver-identified scores or records.
- Using location or any data from off-duty time.
- Combining the score with route deviation alerts to assign blame.
- Making any employment decision automatically, without a person reviewing the facts.
- Scoring a driver who has fewer than 500 km in the window or on routes where gradient data is missing.

7. Driver safeguards and appeals

Safeguard	Commitment
Transparency	Driver sees own score, each component, and for braking the gradient band and threshold applied.
Minimum evidence	No score under 500 km in 28 days; no score when more than 5% of distance has unknown gradient.
Appeal	Driver (or union rep) may challenge a score or event within 14 days; answer within 10 working days; score marked "under review" and unusable until resolved.
Context	Weather, load, traffic and vehicle faults can be recorded as mitigating context.
New route or truck	28 days without any action on the score after a route reassignment (TN-6).
Human review	Any employment decision must rest on verified facts reviewed by a person; the score may not be the reason.

8. Governance, metric changes and enforcement

- **Governance Board:** Fleet Manager, two union representatives, Data Protection Officer, insurer observer (non-voting). Meets monthly; reviews fairness statistics (correlation with terrain, paired differences), access reports and complaints.
- **Metric changes:** the insurer-facing KPI (terrain-normalised harsh-braking rate per 100 km) is frozen for 12 months. Changes need Board approval and a restated baseline. A confirmed terrain-fairness defect is an emergency change.
- **Independent review:** the union may trigger an external review of the scoring method.
- **Enforcement:** misuse of data or the score is itself a disciplinary matter for the person who misused it; access is revoked immediately.
- **Policy changes:** only through the Board, with written notice to all drivers.

9. Sign-off

Role	Name	Signature / date
Fleet Manager		
Union representative		
Insurer liaison (acknowledged)		
Legal / Data Protection Officer		
Project Manager
